

SFB-Seminar Research Project C5

TIME:

6 May 2014, 15:00 - 17:30

LOCATION:

Humboldt-Universität zu Berlin
Institut für Mathematik und Institut für Physik
IRIS Gebäude, Vortragsraum 2.07
Zum Großen Windkanal 6
12489 Berlin-Adlershof

PROGRAM:

15:00 - 16:00 **Prof. Maxim Zabzine (Uppsala University)**

Localization in quantum field theory

The main idea of Berline-Vergne and Atiyah-Bott localisation formulas is that the certain multidimensional integral can be evaluated exactly by summing up a number of fixed points contributions. I will discuss how these ideas can be generalized to infinite dimensional setup in the context of quantum field theory. As an illustration I will discuss briefly the example of 3D Chern-Simons theory.

16:00 - 16:30 Break

16:30 - 17:30 **Prof. Gerald Dunne (University of Connecticut)**

Resurgence and Non-Perturbative Physics

"Resurgent" semiclassical analysis, a systematic unification of perturbative and non-perturbative sectors, can be applied to resolve fundamental problems in quantum theories with degenerate minima. Expansions about different saddle points are quantitatively related to one another in a precise manner. Illustrations include double-well and

periodic potentials in QM, and asymptotically free QFTs such as CPN and Yang-Mills, where this resurgent approach yields a new semiclassical interpretation of IR renormalons.
